## DAA Assignment -2

**Goal :** Comparing the time taken by a recursive function and a non-recursive function for finding the value of function  $2^n$ .

### Non recursive method

**Function :**

```
def multiply(n):  
    answer = 1  
    while n:  
        answer*=2  
        n-=1  
    return answer
```

The time taken for various values of n is as follows.

Value of n	Time taken in seconds
1	2.15e-06
10	2.62e-06
100	1.71e-05
500	8.08e-05
955	1.82e-04

### Recursive Method

**Function :**

```
def exponent(n):  
    if n == 0:  
        return 1  
    else:  
        return 2 * exponent(n - 1)
```

The time taken for various values of n is as follows.

Value of n	Time taken in seconds
1	3.57e-06
10	1.21e-05
100	4.67e-05
500	2.61e-04
955	5.41e-04

## Observations:

- I was not able to test for higher values of n because of the recursion limitation in python. But it would've been completely possible with looping method.
- Just from the table we can clearly see that in every case, looping method has proven to be faster than recursive method and at higher value of n it has proven to be even better.

- The reason for this might be the depth of recursion, repeated number of function calls. Each function occupies a lot of memory hence the poor performance.

### Calculating Complexity :

$$\begin{aligned} &0, 1, 2 \\ &-1, -2, -3 \\ &T(n) = 2^k T(n-k) \\ &T(0) = 1 \\ &T(1) = 2^1 T(0) \quad \boxed{T(1) = 2} \\ &T(2) = 2^2 T(0) = 4 \\ &\vdots \\ &T(n) = 2^k T(n-k) \\ &2^n T(0) = 2^k T(n-k) \\ &\boxed{0 = n-k} \\ &\Rightarrow \boxed{n=k} \\ &\boxed{O(n)} \end{aligned}$$
